Go程序调试、分析与优化

- 八月 25, 2015
- 17条评论

Brad Fitzpatrick在YAPC Asia 2015 (Yet Another Perl Conference)上做了一次技术分享,题为: "Go Debugging, Profiling, and Optimization"。个人感觉这篇分享中价值最大的是BradFitz现场演示的一个有关如何对Go程序进行调试、分析和优化的 Demo,Brad将demo上传到了他个人在github.com的 repo中,但不知为何,repo中的代码似乎与repo里talk.md中的说明不甚一致(btw,我并没有看 video)。于是打算在这里按照Brad的思路重新走一遍demo的演示流程(所有演示代码在这里可以下载到)。

一、实验环境

\$go version

```
$uname -a
Linux pc-tony 3.13.0-61-generic #100~precise1-Ubuntu SMP Wed Jul 29
12:06:40 UTC 2015 x86_64 x86_64 x86_64 GNU/Linux
```

注意:在Darwin或Windows下, profile的结果可能与这里有很大不同(甚至完全不一样的输出和瓶颈热点)。

```
go version go1.5 linux/amd64
$ go env
GOARCH="amd64"
GOBIN="/home1/tonybai/.bin/go15/bin"
GOEXE=""
GOHOSTARCH="amd64"
GOHOSTOS="linux"
GOOS="linux"
GOPATH="/home1/tonybai/proj/GoProjects"
GORACE=""
GOROOT="/home1/tonybai/.bin/go15"
GOTOOLDIR="/home1/tonybai/.bin/go15/pkg/tool/linux amd64"
GO15VENDOREXPERIMENT="1"
CC="qcc"
GOGCCFLAGS="-fPIC -m64 -pthread -fmessage-length=0"
CXX="q++"
```

```
CGO ENABLED="1"
代码基于Brad的github.com/bradfitz/talk-yapc-asia-2015。
二、待优化程序(step0)
待优化程序,也就是原始程序,我们放在step0中:
//go-debug-profile-optimization/step0/demo.go
package main
import (
    "fmt"
    "log"
    "net/http"
    "regexp"
)
var visitors int
func handleHi(w http.ResponseWriter, r *http.Request) {
    if match, := regexp.MatchString(`^\w*$`, r.FormValue("color"));
!match {
        http.Error(w, "Optional color is invalid",
http.StatusBadRequest)
        return
   visitors++
   w.Header().Set("Content-Type", "text/html; charset=utf-8")
   w.Write([]byte("<h1 style='color: " + r.FormValue("color") +</pre>
        "'>Welcome!</h1>You are visitor number " + fmt.Sprint(visitors)
+ "!"))
func main() {
    log.Printf("Starting on port 8080")
   http.HandleFunc("/hi", handleHi)
    log.Fatal(http.ListenAndServe("127.0.0.1:8080", nil))
}
$go run demo.go
2015/08/25 09:42:35 Starting on port 8080
在浏览器输入: http://localhost:8080/hi
```

一切顺利的话,页面会显示:

Welcome!

You are visitor number 1!

三、添加测试代码

按照talk.md中的说明, brad repo中demo中根本没有测试代码(commit 2427d0faa12ed1fb05f1e6a1e69307c11259c2b2)。

于是我根据作者的意图,新增了demo_test.go,采用TestHandleHi_Recorder和TestHandleHi_TestServer对HandleHi进行测试:

```
//go-debug-profile-optimization/step0/demo test.go
package main
import (
    "bufio"
    "net/http"
    "net/http/httptest"
    "strings"
    "testing"
)
func TestHandleHi Recorder(t *testing.T) {
    rw := httptest.NewRecorder()
    handleHi(rw, req(t, "GET / HTTP/1.0\r\n\r\n"))
    if !strings.Contains(rw.Body.String(), "visitor number") {
        t.Errorf("Unexpected output: %s", rw.Body)
    }
}
func req(t *testing.T, v string) *http.Request {
    req, err := http.ReadRequest(bufio.NewReader(strings.NewReader(v)))
    if err != nil {
        t.Fatal(err)
    return req
}
func TestHandleHi TestServer(t *testing.T) {
    ts := httptest.NewServer(http.HandlerFunc(handleHi))
    defer ts.Close()
    res, err := http.Get(ts.URL)
    if err != nil {
        t.Error(err)
        return
    if q, w := res.Header.Get("Content-Type"), "text/html; charset=utf-
8"; q != w {
        t.Errorf("Content-Type = %q; want %q", g, w)
```

```
}
    slurp, err := ioutil.ReadAll(res.Body)
    defer res.Body.Close()
    if err != nil {
       t.Error(err)
       return
    t.Logf("Got: %s", slurp)
}
$ go test -v
=== RUN TestHandleHi Recorder
- PASS: TestHandleHi Recorder (0.00s)
=== RUN TestHandleHi TestServer
- PASS: TestHandleHi TestServer (0.00s)
    demo test.go:45: Got: <h1 style='color: '>Welcome!</h1>You are
visitor number 2!
PASS
ok
       /home1/tonybai/proj/opensource/github/experiments/go-debug-
profile-optimization/step0 0.007s
```

测试通过!

至此, step0使命结束。

四、Race Detector(竞态分析)

并发设计使得程序可以更好更有效的利用现代处理器的多核心。但并发设计很容易引入竞态,导致严重bug。Go程序中竞态就是当多个goroutine并发访问某共享数据且未使用同步机制时,且至少一个goroutine进行了写操作。不过go工具自带race分析功能。在分析优化step0中demo代码前,我们先要保证demo代码中不存在竞态。

工具的使用方法就是在go test后加上-race标志,在step0目录下:

-race通过做运行时分析做竞态分析,虽然不存在误报,但却存在实际有竞态,但工具没发现的情况。接下来我们改造一下测试代码,让test并发起来:

向step1(copy自step0)中demo_test.go中添加一个test method:

```
//go-debug-profile-optimization/step1/demo test.go
func TestHandleHi TestServer Parallel(t *testing.T) {
    ts := httptest.NewServer(http.HandlerFunc(handleHi))
    defer ts.Close()
    var wg sync.WaitGroup
    for i := 0; i < 2; i++ {
        wq.Add(1)
        go func() {
            defer wg.Done()
            res, err := http.Get(ts.URL)
            if err != nil {
                t.Error(err)
                return
            }
            if g, w := res.Header.Get("Content-Type"), "text/html;
charset=utf-8"; q != w {
                t.Errorf("Content-Type = %q; want %q", q, w)
            slurp, err := ioutil.ReadAll(res.Body)
            defer res.Body.Close()
            if err != nil {
                t.Error(err)
                return
            t.Logf("Got: %s", slurp)
        } ()
   wg.Wait()
}
执行竞态test:
$ go test -v -race
=== RUN TestHandleHi Recorder
- PASS: TestHandleHi Recorder (0.00s)
=== RUN TestHandleHi TestServer
- PASS: TestHandleHi TestServer (0.00s)
    demo test.go:46: Got: <h1 style='color: '>Welcome!</h1>You are
visitor number 2!
=== RUN
          TestHandleHi TestServer Parallel
==============

=============
- PASS: TestHandleHi TestServer Parallel (0.00s)
    demo test.go:71: Got: <h1 style='color: '>Welcome!</h1>You are
visitor number 3!
    demo test.go:71: Got: <h1 style='color: '>Welcome!</h1>You are
visitor number 4!
PASS
Found 1 data race(s)
exit status 66
       /home1/tonybai/proj/opensource/github/experiments/go-debug-
profile-optimization/step1
                            1.023s
工具发现demo.go第17行:
   visitors++
是一处潜在的竞态条件。
```

visitors被多个goroutine访问但未采用同步机制。

既然发现了竞态条件,我们就需要fix it。有多种fix方法可选:

- 1、使用channel 2、使用Mutex
- 3、使用atomic

Brad使用了atomic:

```
//go-debug-profile-optimization/step1/demo.go
var visitors int64 // must be accessed atomically
func handleHi(w http.ResponseWriter, r *http.Request) {
    if match, := regexp.MatchString(`^\w*$`, r.FormValue("color"));
!match {
       http.Error(w, "Optional color is invalid",
http.StatusBadRequest)
        return
   visitNum := atomic.AddInt64(&visitors, 1)
   w.Header().Set("Content-Type", "text/html; charset=utf-8")
   w.Write([]byte("<h1 style='color: " + r.FormValue("color") +</pre>
        "'>Welcome!</h1>You are visitor number " + fmt.Sprint(visitNum)
+ "!"))
... ...
再做一次测试:
$ go test -v -race
=== RUN TestHandleHi Recorder
- PASS: TestHandleHi Recorder (0.00s)
=== RUN
         TestHandleHi TestServer
- PASS: TestHandleHi TestServer (0.00s)
    demo test.go:46: Got: <h1 style='color: '>Welcome!</h1>You are
visitor number 2!
         TestHandleHi_TestServer_Parallel
- PASS: TestHandleHi TestServer Parallel (0.00s)
    demo test.go:71: Got: <h1 style='color: '>Welcome!</h1>You are
visitor number 3!
    demo test.go:71: Got: <h1 style='color: '>Welcome!</h1>You are
visitor number 4!
PASS
        /home1/tonybai/proj/opensource/github/experiments/go-debug-
profile-optimization/step1
                            1.020s
```

竞杰条件被消除了!

至此, step1结束了使命!

五、CPU Profiling

要做CPU Profilling, 我们需要benchmark数据, Go test提供benchmark test功能, 我们只要写对应的Benchmark测试方法即可:

```
//go-debug-profile-optimization/step2/demo test.go
func BenchmarkHi(b *testing.B) {
   b.ReportAllocs()
   req, err := http.ReadRequest(bufio.NewReader(strings.NewReader("GET
/ HTTP/1.0\r\n\r\n")))
   if err != nil {
       b.Fatal(err)
    }
   for i := 0; i < b.N; i++ {
       rw := httptest.NewRecorder()
       handleHi(rw, req)
}
... ...
$ go test -v -run=^$ -bench=.
PASS
BenchmarkHi-4
                 100000
                                 14808 ns/op
                                                    4961 B/op
81 allocs/op
       /home1/tonybai/proj/opensource/github/experiments/go-debug-
profile-optimization/step2 1.648s
开始CPU Profiling:
$ go test -v -run=^$ -bench=^BenchmarkHi$ -benchtime=2s -
cpuprofile=prof.cpu
PASS
                                 14679 ns/op
BenchmarkHi-4
                  200000
                                                    4961 B/op
81 allocs/op
       /home1/tonybai/proj/opensource/github/experiments/go-debug-
profile-optimization/step2 3.096s
执行完benchmark test后, step2目录下出现两个新文件prof.cpu和step2.test, 这两个
文件将作为后续go tool pprof的输入:
```

demo test.go prof.cpu step2.test*

\$1s

demo.go

使用go profile viewer工具:

```
$ go tool pprof step2.test prof.cpu
Entering interactive mode (type "help" for commands)

      10ms
                         18:
                               visitNum := atomic.AddInt64(&visitors,
                20ms
1)
      10ms
                90ms
                         19:
                             w.Header().Set("Content-Type",
"text/html; charset=utf-8")
      10ms
                         20: w.Write([]byte("<h1 style='color: " +</pre>
r.FormValue("color") +
               200ms
                         21:
                                    "'>Welcome!</h1>You are visitor
number " + fmt.Sprint(visitNum) + "!"))
                         22:}
                         23:
                         24:func main() {
                         25:
                                log.Printf("Starting on port 8080")
                              http.HandleFunc("/hi", handleHi)
                         26:
(pprof)
从top -cum来看, handleHi消耗cpu较大, 而handleHi中, 又是MatchString耗时最长。
六、第一次优化
前面已经发现MatchString较为耗时,优化手段:让正则式仅编译一次(step3):
// go-debug-profile-optimization/step3/demo.go
var visitors int64 // must be accessed atomically
var rxOptionalID = regexp.MustCompile(`^\d*$`)
func handleHi(w http.ResponseWriter, r *http.Request) {
    if !rxOptionalID.MatchString(r.FormValue("color")) {
        http.Error(w, "Optional color is invalid",
http.StatusBadRequest)
       return
    }
   visitNum := atomic.AddInt64(&visitors, 1)
   w.Header().Set("Content-Type", "text/html; charset=utf-8")
    w.Write([]byte("<h1 style='color: " + r.FormValue("color") +</pre>
        "'>Welcome!</h1>You are visitor number " + fmt.Sprint(visitNum)
+ "!"))
}
```

运行一下bench:

\$ go test -bench=. PASS BenchmarkHi-4 1000000

1678 ns/op

720 B/op

9 allocs/op

/home1/tonybai/proj/opensource/github/experiments/go-debugprofile-optimization/step3 1.710s

对比之前在step2中运行的bench结果:

\$ go test -v -run=^\$ -bench=.

PASS

BenchmarkHi-4

100000

14808 ns/op

4961 B/op

81 allocs/op

/home1/tonybai/proj/opensource/github/experiments/go-debugprofile-optimization/step2 1.648s

耗时相同,但优化后的bench运行了100w次,而之前的Bench运行10w次,相当于性能提高10倍。

再看看cpu prof结果:

\$ go test -v -run=^\$ -bench=^BenchmarkHi\$ -benchtime=3s cpuprofile=prof.cpu

PASS

BenchmarkHi-4 3000000 1640 ns/op

720 B/op

9 allocs/op

/home1/tonybai/proj/opensource/github/experiments/go-debugprofile-optimization/step3 6.540s

\$ go tool pprof step3.test prof.cpu

Entering interactive mode (type "help" for commands)

```

handleHi耗时有一定下降。

七、Mem Profiling

在step3目录下执行bench, 获取mem分配数据:

使用pprof工具分析mem:

```
$ go tool pprof -alloc space step3.test prof.mem
Entering interactive mode (type "help" for commands)
(pprof) top
2065.91MB of 2067.41MB total (99.93%)
Dropped 14 nodes (cum <= 10.34MB)
      flat flat%
                   sum%
                                cum
                                      cum%
1076.35MB 52.06% 52.06% 1076.35MB 52.06%
net/textproto.MIMEHeader.Set
  535.54MB 25.90% 77.97% 2066.91MB
                                            step3.BenchmarkHi
                                      100%

(pprof) list handleHi
Total: 2.02GB
    ROUTINE ======step3.handleHi in step3/demo.go
               1.50GB (flat, cum) 74.07% of Total
  406.52MB
                                     http.Error(w, "Optional color is
                          17:
invalid", http.StatusBadRequest)
                          18:
                                     return
                          19:
                                 }
                          20:
                          21: visitNum := atomic.AddInt64(&visitors,
1)
               1.05GB
                          22:
                                 w.Header().Set("Content-Type",
"text/html; charset=utf-8")
                          23:
                                w.Write([]byte("<h1 style='color: " +</pre>
r.FormValue("color") +
  406.52MB
           455.02MB
                          24:
                                     "'>Welcome!</h1>You are visitor
number " + fmt.Sprint(visitNum) + "!"))
                          25:}
                          26:
                          27:func main() {
                          28:
                                log.Printf("Starting on port 8080")
                          29: http.HandleFunc("/hi", handleHi)
(pprof)
```

可以看到handleHi22、23两行占用了较多内存。

八、第二次优化

第二次优化的方法:

- 1、删除w.Header().Set**这行**
- 2、用fmt.Fprintf替代w.Write

```
第二次优化的代码在step4目录中:
```

```
// go-debug-profile-optimization/step4/demo.go
func handleHi(w http.ResponseWriter, r *http.Request) {
    if !rxOptionalID.MatchString(r.FormValue("color")) {
        http.Error(w, "Optional color is invalid",
http.StatusBadRequest)
       return
    }
    visitNum := atomic.AddInt64(&visitors, 1)
    fmt.Fprintf(w, "<html><h1 stype='color: \"%s\"'>Welcome!</h1>You
are visitor number %d!", r.FormValue("color"), visitNum)
... ...
执行一遍pprof:
$ go test -v -run=^$ -bench=^BenchmarkHi$ -benchtime=2s -
memprofile=prof.mem
PASS
                                  1428 ns/op
BenchmarkHi-4
                                                     304 B/op
                  2000000
      6 allocs/op
        _/home1/tonybai/proj/opensource/github/experiments/go-debug-
ok
profile-optimization/step4
                            4.343s
$ go tool pprof -alloc space step4.test prof.mem
Entering interactive mode (type "help" for commands)
(pprof) top

(*ResponseRecorder).Write
(pprof) list handleHi
Total: 868.56MB
ROUTINE ======= step4.handleHi in step4/demo.go
            308.52MB (flat, cum) 35.52% of Total
                         17:
                                   http.Error(w, "Optional color is
invalid", http.StatusBadRequest)
                        18:
                                   return
                        19:
                        20:
                         21: visitNum := atomic.AddInt64(&visitors,
1)
            308.52MB 22: fmt.Fprintf(w, "<html><h1
     89MB
stype='color: \"%s\"'>Welcome!</h1>You are visitor number %d!",
r.FormValue("color"), visitNum)
                        23:}
                         24:
                        25:func main() {
                        26: log.Printf("Starting on port 8080")
                        27: http.HandleFunc("/hi", handleHi)
(pprof)
```

可以看出内存占用大幅减少。

九、Benchemp

golang.org/x/tools中有一个工具: benchcmp, 可以给出两次bench的结果对比。

github.com/golang/tools是golang.org/x/tools的一个镜像。安装benchcmp步骤:

```
1. go get -u github.com/golang/tools
2. mkdir -p $GOPATH/src/golang.org/x
3. mv $GOPATH/src/github.com/golang/tools $GOPATH/src/golang.org/x
```

4, go install golang.org/x/tools/cmd/benchcmp

我们分别在step2、step3和step4下执行如下命令:

\$ go-debug-profile-optimization/step2\$ go test -bench=. memprofile=prof.mem | tee mem.2

PASS

BenchmarkHi-4 100000 14786 ns/op 4961 B/op

81 allocs/op

ok _/home1/tonybai/proj/opensource/github/experiments/go-debug-profile-optimization/step2 1.644s

go-debug-profile-optimization/step3\$ go test -bench=. memprofile=prof.mem | tee mem.3

PASS

BenchmarkHi-4 1000000 1662 ns/op 720 B/op

9 allocs/op

ok _/homel/tonybai/proj/opensource/github/experiments/go-debug-profile-optimization/step3 1.694s

go-debug-profile-optimization/step4\$ go test -bench=. memprofile=prof.mem | tee mem.4

PASS

benchmark

BenchmarkHi-4 1000000 1428 ns/op 304 B/op

6 allocs/op

ok _/home1/tonybai/proj/opensource/github/experiments/go-debug-profile-optimization/step4 1.456s

new ns/op

delta

利用benchcmp工具对比结果(benchcmp old new):

\$ benchcmp step3/mem.3 step4/mem.4

BenchmarkHi-4 1662 1428 -14.08%

benchmark old allocs new allocs delta
BenchmarkHi-4 9 6 -33.33%

old ns/op

benchmark old bytes new bytes delta BenchmarkHi-4 720 304 -57.78%

\$ benchcmp step2/mem.2 step4/mem.4

benchmark old ns/op new ns/op delta BenchmarkHi-4 14786 1428 -90.34%

benchmark old allocs new allocs delta
BenchmarkHi-4 81 6 -92.59%

benchmark old bytes new bytes delta BenchmarkHi-4 4961 304 -93.87% 可以看出优化后,内存分配大幅减少,gc的时间也随之减少。

十、内存来自哪

我们在BenchmarkHi中清理每次handleHi执行后的内存:

```
//step5/demo test.go
func BenchmarkHi(b *testing.B) {
   b.ReportAllocs()
    req, err := http.ReadRequest(bufio.NewReader(strings.NewReader("GET
/ HTTP/1.0\r\n\r\n")))
    if err != nil {
        b.Fatal(err)
    }
    for i := 0; i < b.N; i++ {
        rw := httptest.NewRecorder()
        handleHi(rw, req)
        reset(rw)
    }
func reset(rw *httptest.ResponseRecorder) {
    m := rw.HeaderMap
    for k := range m {
        delete(m, k)
   body := rw.Body
    body.Reset()
    *rw = httptest.ResponseRecorder{
        Body:
                  body,
        HeaderMap: m,
    }
}
$ go test -v -run=^$ -bench=^BenchmarkHi$ -benchtime=2s -
memprofile=prof.mem
PASS
BenchmarkHi-4 2000000
                                   1518 ns/op
                                                       304 B/op
       6 allocs/op
        /home1/tonybai/proj/opensource/github/experiments/go-debug-

                                http.HandleFunc("/hi", handleHi)
(pprof)
内存从300MB降到111MB。内存来自哪?看到list handleHi,fmt.Fprintf分配了111.51MB。
```

我们来看这一行代码:

```
fmt.Fprintf(w, "<h1 style='color: %s'>Welcome!</h1>You are visitor
number %d!",
```

r.FormValue("color"), num)

fmt.Fprintf的manual:

```
$ go doc fmt.Fprintf
func Fprintf(w io.Writer, format string, a ...interface{}) (n int, err
error)
```

Fprintf formats according to a format specifier and writes to w. It returns

the number of bytes written and any write error encountered.

这里回顾一下Go type在runtime中的内存占用:

```
A Go interface is 2 words of memory: (type, pointer).

A Go string is 2 words of memory: (base pointer, length)

A Go slice is 3 words of memory: (base pointer, length, capacity)
```

每次调用fmt.Fprintf,参数以value值形式传入函数时,程序就要为每个变参分配一个占用16bytes 的empty interface,然后用传入的类型初始化该interface value。这就是这块累计分配内存较多的原因。

十一、消除所有内存分配

下面的优化代码可能在实际中并不需要,但一旦真的成为瓶颈,可以这么做:

```
//go-debug-profile-optimization/step6/demo.go
var bufPool = sync.Pool{
   New: func() interface{} {
        return new(bytes.Buffer)
    },
}
func handleHi(w http.ResponseWriter, r *http.Request) {
    if !rxOptionalID.MatchString(r.FormValue("color")) {
        http.Error(w, "Optional color is invalid",
http.StatusBadRequest)
        return
    }
    visitNum := atomic.AddInt64(&visitors, 1)
    buf := bufPool.Get().(*bytes.Buffer)
    defer bufPool.Put(buf)
   buf.Reset()
   buf.WriteString("<h1 style='color: ")</pre>
   buf.WriteString(r.FormValue("color"))
    buf.WriteString("'>Welcome!</h1>You are visitor number ")
   b := strconv.AppendInt(buf.Bytes(), int64(visitNum), 10)
   b = append(b, '!')
    w.Write(b)
}
```

```
$ go test -v -run=^$ -bench=^BenchmarkHi$ -benchtime=2s -
memprofile=prof.mem
PASS
BenchmarkHi-4 5000000
                                  780 ns/op

                                              -50.00%
benchmark
                 old bytes new bytes delta
BenchmarkHi-4
                 304
                              192
                                            -36.84%
```

可以看到handleHi已经不在top列表中了。benchcmp结果也显示内存分配又有大幅下降!

十二、竞争(Contention)优化

为handleHi编写一个Parallel benchmark test:

```
//go-debug-profile-optimization/step7/demo_test.go
... ...
func BenchmarkHiParallel(b *testing.B) {
    r, err := http.ReadRequest(bufio.NewReader(strings.NewReader("GET / HTTP/1.0\r\n\r\n")))
```

```
if err != nil {
       b.Fatal(err)
    }
    b.RunParallel(func(pb *testing.PB) {
        rw := httptest.NewRecorder()
        for pb.Next() {
            handleHi(rw, r)
            reset(rw)
        }
    })
}
执行测试,并分析结果:
$ go test -bench=Parallel -blockprofile=prof.block
PASS
BenchmarkHiParallel-4
                          5000000
                                            305 ns/op
       /home1/tonybai/proj/opensource/github/experiments/go-debug-
profile-optimization/step7
                            1.947s
$ go tool pprof step7.test prof.block
Entering interactive mode (type "help" for commands)

1)
              2.50us
                         29:
                               buf := bufPool.Get().(*bytes.Buffer)
                         30:
                               defer bufPool.Put(buf)
                         31:
                               buf.Reset()
                               buf.WriteString("<h1 style='color: ")</pre>
                         32:
                              buf.WriteString(r.FormValue("color"))
                         33:
                               buf.WriteString("'>Welcome!</h1>You
                         34:
are visitor number ")
(pprof)
handleHi中MatchString这块是一个焦点,这里耗时较多。
```

优化方法 (step8):

```
//go-debug-profile-optimization/step8/demo.go
... ...
```

```
var colorRxPool = sync.Pool{
    New: func() interface{} { return regexp.MustCompile(`\w*$`) },
}
func handleHi(w http.ResponseWriter, r *http.Request) {
    if !colorRxPool.Get().
(*regexp.Regexp).MatchString(r.FormValue("color")) {
        http.Error(w, "Optional color is invalid",
http.StatusBadRequest)
        return
    }
    visitNum := atomic.AddInt64(&visitors, 1)
   buf := bufPool.Get().(*bytes.Buffer)
    defer bufPool.Put(buf)
   buf.Reset()
   buf.WriteString("<h1 style='color: ")</pre>
   buf.WriteString(r.FormValue("color"))
   buf.WriteString("'>Welcome!</h1>You are visitor number ")
   b := strconv.AppendInt(buf.Bytes(), int64(visitNum), 10)
   b = append(b, '!')
    w.Write(b)
}
... ...

```
. 35: buf.WriteString("<h1 style='color: ")
. 36: buf.WriteString(r.FormValue("color"))
. 37: buf.WriteString("'>Welcome!</h1>You
are visitor number ")
(pprof)
```

优化后, MatchString从43ms降到5.66ms。

在 CPU profiling 中,下面这个命令出错

go test -v -run=^\$ -bench=.

提示 no matches found: -run=^\$

-run regexp Run only those tests and examples matching the regular expression.

^\$是正则式,我在go 1.5 ubuntu amd64下执行没有问题啊。你的go版本和环境是?

回复

\$ uname -a

Linux shhl2 3.16.0-30-generic #40~14.04.1-Ubuntu SMP Thu Jan 15 17:43:14 UTC 2015 x86_64 x86_64 x86_64 GNU/Linux

\$ go version

go version go1.5 linux/amd64

我用的是 zsh

回复

可以将-run去掉试试。

<u>回复</u>

原来微博的昵称真的可以好长好长

2015/09/02

博客的模板比较差啊。。。代码段看起来非常不舒服。。。影响文章质量了都~不过,内容很精彩实用~赞~

2016/01/09

我手头没有windows go开发环境,工作中也不用windows,您自己不妨摸索一下,有结论后,别忘了在这里的评论中补上一句。呵呵。

回复

写的很不错,其中有个问题指出,以免后看者在测试验证时浪费不必要的时间使用pprof工具分析mem: \$ go tool pprof –alloc_space step3.test prof.memEntering interactive mode (type "help" for commands)—中划线大写了–alloc_space (错误) -alloc_space

8. <u>small-pig</u> 2018/05/06

```
//go-debug-profile-optimization/step0/demo.go
package main
import (
"fmt"
"log"
"net/http"
"regexp"
// must be accessed atomically
var add = make(chan struct{})
var total = make(chan int)
func getVistors() int {
return <-total
}
func addVistors() {
add <- struct{}{}
}
```

func teller() {

```
var visitors int
for {
select {
case <-add:
visitors += 1
case total <- visitors:
}
}
}
func handleHi(w http.ResponseWriter, r *http.Request) {
if match, _ := regexp.MatchString(`^\w*\$`, r.FormValue("color")); !match {
http.Error(w, "Optional color is invalid", http.StatusBadRequest)
return
}
addVistors()
visitNum := getVistors()
w.Header().Set("Content-Type", "text/html; charset=utf-8")
w.Write([]byte("Welcome!You are visitor number " + fmt.Sprint(visitNum) + "!"))
}
func main() {
log.Printf("Starting on port 8080")
go teller()
http.HandleFunc("/hi", handleHi)
log.Fatal(http.ListenAndServe("127.0.0.1:8080", nil))
}
请问big white大大,我使用了channel,为什么go test的时候会不成功?
现象是go test timeout。
     small-pig
2018/05/06
不好意思
var c = make(chan struct\{\}, 1)
func handleVistors() {
c <- struct{}{}
vistors++
<-c
}
我这样写,测试依旧不通过,依旧是timeout。不知道为什么。
回复
```

2018/05/07

无论是否是buffered channel,go test执行到TestHandleHi_Recorder时,只是直接调用了handleHi,而你在demo.go中写的teller() goroutine并没有启动啊。因此测试始终阻塞在那里了啊。应该是visitors这个channel上。

你好,

不太理解step 8 为什么会优化之前的做法[让正则仅编译一次]。 我浅显的理解,sync.Pool不是会不定时被gc掉么,如果被gc了的话,又要重新编译正则了。

回复

regexp.Regexp内部是有一个mutex的,因此是goroutine-safe的,但mutex在并发时存在一定的性能损耗。step8目的就是建立一个regexp.Regexp pool,这样多个goroutine按需获取,这样不用每收到一个连接就创建一个Regexp,sync.Pool中的对象是暂时性的,在两个GC周期之间未被get出去的object会被gc掉,但pool的确增加对象重用的几率,减少gc的负担,因此一定程度上减少内存分配,提升整体性能。
